Abstract

This will be the place for my abstract where I can include the general idea behind the project and a sample of the conclusion and results. At some point I will include my theory table. This theory table will include the following theories:

1 Introduction

Here I will define some terms and get the reader familiar with what the project will cover.

Theory	Explanation	Reasoning
Subprime Loans lead to less secure housing	Subprime loans ...	Subprime Loans lead to more single family housing lead to less multi-unit housing lead to higher housing costs and less housing in total
Higher income leads to housing security	Something...	Place with higher income lead to housing developers building larger and better houses that are then safer and more reddibly available so housing security is better
Race has a correlation with housing security	something	There is a long standing understanding that intentional and unintentional seggregation has led to seggregation in housing

1.1 Background

This will specifically include what subprime loans are / what they are used for and the time period(s) that we are focusing on.

1.2 Motivation

Here I will specify why we are interested specifically in the long tail impacts of subprime loans.

1.3 Literature Gaps?

Here I might include some information on how other papers have avoided this topic and how this paper will be unique.

1.4 Overview of Methodology

Here I will include the general idea behind the structure of the paper and the way that we will attempt to answer our given question.

2 Literature Review

Here I will cover information provided by many other articles that cover the information that may be found in this paper. Along with this, I will contextualize the problem in the space of other tried methodologies and papers. (there will probably be some subsections but idk what they will be called)

3 Methods

I will cover the methods that we took to get this data and analyze it.

3.1 Data Collection and Choice

Here I will cover why I choose the data that I did.

3.2 Variable Analysis

I will talk about why certain variables are important and how they will be derived from the data that we acquired.

3.3 Modeling

This will contain information on how the models were generated and why they were made in this way.

4 Results

I will discuss what our results are including relevant figures and context. (again probably there will be some subsections but idk what they will be yet)

5 Discussion

Now I will finally start expanding back up to larger generalizations and how the results may impact the wider housing market and even other financial markets. (probably subsections for each large impact)
